

Introduction to High-Performance Computing (HPC)

HPC Cluster

- multi-user, shared resource
- lots of nodes = lots of processing capacity + lots of memory
- a system like this requires constant maintenance and upkeep, and there is an associated cost

It's cake time for RC -- happy birthday to O2 !!

Sep 12, 2017

HMSResearchComputing @hms_rc

O2 is officially being launched today as the new RC production HPC cluster!! (thnx beta testers!) Get started at: hmsrc.me/O2docs

Sep 12, 2017

Introduction to High Performance Computing and O2 for New Users

HMS Research Computing

(Slides courtesy of Kris Holton & Kathleen Keating at HMS-RC)

Welcome to O2!

- HMS Research Computing's newest High-Performance Compute cluster to enhance the compute capacity available to HMS Researchers
- Heterogeneous environment of newer, faster cores with high memory allocation to facilitate multi-core and parallelized workflows
- SLURM scheduler to efficiently dispatch jobs

O2 Tech Specs

- 11000+ cores
- 32, 28, or 20 cores per node
- 256-160GB RAM (memory) per node (8-9GB/core)
- 9 756GB RAM and 1 1TB highmem nodes
- 32 GPUs (8 V100, 16 K80, 8 M40)
- CentOS 7 Linux
- SLURM job scheduler

2-Factor Authentication

- For logins using WiFi networks other than HMS Private/Harvard Secure
- Easiest: download Duo app to phone
- Similar to the setup for Harvard Key logins
- Setup details at:
<https://wiki.rc.hms.harvard.edu:8443/display/O2/Two+Factor+Authentication+on+O2>

Using O2!

1. Logging in to remote machines (securely)

- When logging in we used the “ssh” command,
ssh stands for Secure Shell
- **ssh** is a protocol for data transfer that is secure, i.e the data is encrypted as it travels between your computer and the cluster (remote computer)
- Commonly used commands that use the **ssh** protocol for data transfer are, **scp** and **sftp**

Logging Into O2

- Open a terminal

```
ssh yourEcommons@o2.hms.harvard.edu
```

- If outside of “approved” internet sources (HMS Private/Harvard Secure):
Type 1/2/3 for DUO push/sms/phone

Welcome to O2!

Where are you in O2?

```
mfk8@login01:~$
```

You are logged into a “**shell login server**”,
login01-05. These are not meant for heavy lifting!

```
mfk8@login01:~$ pwd
```

You are in your home directory.

Interactive Sessions

- The login servers are not designed to handle intensive processes, and CPU usage is throttled.
- Start by entering your first job! This will (usually) log you into a “**compute** node!”

```
mfk8@login01:~$ srun --pty -p interactive -t 0-12:00  
--mem 8G bash
```

“srun --pty” is how interactives are started

“-p interactive” is the partition

“-t 0-12:00” is the time limit (12 hours)

“--mem 8G” is the memory requested

```
mfk8@compute-a:~$
```

2. Using & installing software

LMOD: Software Modules

- Most “software” on O2 is installed as an environment module.
- LMOD system adds directory paths of software into \$PATH variable, to make sure the program runs without any issues.
- Allows for clean, easy loading, including most dependencies, and switching versions.

LMOD: Software Modules

Most software is compiled against something called “gcc-6.2.0” — so, we need to load that before loading other programs that depend on it.

```
$ module load gcc/6.2.0
```

```
$ module avail #to see software now available to load
```

```
$ module spider #verbose list of all software available
```

Loading/Unloading Modules

Check module status (e.g. the alignment tool bowtie2)

```
$ module list
```

```
$ echo $PATH
```

```
$ bowtie2
```

Load the module

```
$ module load bowtie2/2.2.9
```

```
$ bowtie2
```

Which module version is loaded (if at all)?

```
$ which bowtie2
```

```
$ module list
```

```
$ echo $PATH
```

Loading/Unloading Modules

Need help with the module?

```
$ module help bowtie2/2.2.9
```

Unloading modules

```
$ module unload bowtie2/2.2.9
```

Dump all modules

```
$ module purge
```

3. The Job Scheduler, SLURM

Simple Linux Utility for Resource Management (SLURM)

- Fairly **allocates** access to resources (computer nodes) to users for some duration of time so they can perform work
- Provides a **framework** for starting, executing, and monitoring batch jobs
- **Manages** a queue of pending jobs; ensures that no single user or core monopolizes the cluster

Choosing the proper resources for your job with
the appropriate `SBATCH` options

Submitting Jobs

In an “interactive session”, programs can be run directly, however your computer will have to remain connected to the cluster for the duration of this run.

```
mfk8@compute-a:~$ bowtie2 -c 4 hg19 file1_1.fq
```

What if you wanted to run the program, close your computer and come back later to check on it?

A script with the required commands can be submitted to O2 (SLURM) using the `sbatch` command.

```
mfk8@compute-a:~$ sbatch mybowtiejob.sh
```

Creating a job submission script

```
#!/bin/sh

#SBATCH -p short
#SBATCH -t 0-03:00
#SBATCH -c 4
#SBATCH --mem=8G
#SBATCH -o %j.out
#SBATCH -e %j.err
#SBATCH -J bowtie2_run1
#SBATCH --mail-type=ALL
#SBATCH --mail-user=mfk8@med.harvard.edu

module load gcc/6.2.0
module load bowtie2/2.2.9

bowtie -c 4 hg19 file1_1.fq
```

Save script as myJobScript.run and run it as follows:

```
$ sbatch myJobScript.run
```

***O2 will notify you when the job is done, or if there is an error*

Partitions -p

Partition	Priority	Max Runtime	Max Cores	Limits
short	12	12 hours	20	
medium	6	5 days	20	
long	4	30 days	20	
interactive	14	12 hours	20	2 job limit
priority	14	30 days	20	2 job limit
mpi	12	5 days	640	20 core min
highmem	12	5 days	20	750G
gpu		160 GPU hours	34 (total)	420G (total)
transfer		5 days	4	

Runtime: -t

- -t days-hours:minutes
- -t hours:minutes:seconds
- Need to specify how long you estimate your job will run for
- Aim for 125%
- Subject to maximum per partition
- Excessive runlimits (like partition max) take longer to dispatch, and affect fairshare

Cores: -c

- -c X to designate cores: max 20
- -N X to constrain all cores to X nodes
- CPU time: wall time (-t) * (-c) cores used
- Unable to use cores not requested (no overefficient jobs): cgroups constraint
- Adding more cores does not mean jobs will scale linearly with time, and causes longer pend times

Memory: --mem

- Only 1G is allocated by default
- `--mem xG` #total memory over all cores
- `--mem-per-cpu xG` #total memory per CPU requested, use for MPI
- No unit request (G) defaults to Megabytes
 - 8G ~= 8000

Job Priority

- Dynamically assigned
- Factors contributing: Age, Fairshare, Partition, QOS, Nice
- Fairshare: 0-1 scale

Managing jobs and getting information about
submitted/running jobs

Job Monitoring: Current jobs

- `$ O2squeue`
 - JOBID, PARTITION, STATE, TIME_LIMIT, TIME, NODELIST(REASON), ELIGIBLE_TIME, START_TIME, TRES
 - [O2squeue documentation](#)
- *Other options:*
 - `$ squeue -u eCommons -t RUNNING/PENDING`
 - `$ squeue -u eCommons -p Partition`
 - `$ squeue -u eCommons -start`
- *Detailed job info:*
 - `$ scontrol show jobid <jobid>`

Job Information: Past Jobs

- `$ O2sacct`
 - JobID, Partition, State , NodeList, Start, Timelimit, Elapsed, CPUTime , TotalCPU, AllocTRES, MaxRSS
 - Can specify job ID, job status, and/or timeframe to report accounting info
 - [O2sacct documentation](#)
- *Other options:*
 - `$ sacct -j jobid`
 - `$ sacct -r partition`
 - `$ squeue -s state`
 - `$ sacct --helpformat #get` available fields you can specify

Cancelling/Pausing Jobs

- `$ scancel <jobid> #Cancels specific job`
- `$ scancel -t PENDING #Cancels pending job`
- `$ scancel --name JOBNAME #Cancels job by name`
- `$ scancel jobid_[indices] #array indices`
- `$ scontrol hold <jobid> #pause pending jobs`
- `$ scontrol release <jobid> #resume`

Exercise!

4. Filesystems and storage

Filesystems and storage

Filesystems and storage

- Storage on HPC systems is organized differently than on your personal machine
- Physical disks are bundled together into a virtual volume; this volume may represent a single filesystem, or may be divided up, or partitioned, into multiple filesystems
- Filesystems are accessed over the internal network

O2 Primary Storage

O2 Cluster

- 11000+ cores
- SLURM batch system

/home

- [/home/user_id](#)
- quota: 100GB per user
- Backup: extra copy & snapshots:
- daily to 14 days, weekly up to 60 days

/n/data1, /n/data2, /n/groups

- [/n/data1/institution/dept/lab/your_dir](#)
- quota: expandable
- Backup: extra copy & snapshots:
- daily to 14 days, weekly up to 60 days

Temporary “Scratch” storage

- `/n/scratch3/users/<first_eCommons_char>/<eCommons>`
e.g. /n/scratch3/users/m/mfk8
- For data only needed temporarily during analyses
- Each user can use up to 10 TB and 1 million files/directories
- Files not accessed for 30 days are automatically purged
- No backups!
- To create your scratch3 directory run from a login node:

`$ /n/cluster/bin/scratch3_create.sh`
- [Scratch3 documentation](#)

Important Note about O2 Storage

- O2 can only be used to store data of [Harvard Security Level 3](#) and below.
- None of the standard filesystems are automatically encrypted, and **cannot** be used for HIPAA-protected or other secure data (Harvard's data security above level 3) unless those data have been de-identified.

HMS Storage Offerings

- **Active** – available now
 - Formerly Tier 1 (e.g. O2 group folders and research.files, now referred to as Active Compute and Active Collaboration)
 - Research data that is frequently accessed, modified, or computed against.
- **Standby** – available now
 - New and improved alternative to Tier 2
 - Infrequently accessed data, that is directly available for reference, retrieval, or analysis.
- **Cold** – future offering
 - Formerly Tier 3
 - Rarely accessed data requiring long-term retention, for regulatory or historical purposes

HMS Storage Offerings

- For more detail on all the Storage Offerings, please see [the Research Computing Storage Services Website](#).
- Please see [the dedicated Standby Storage page](#) for more information on how to access and utilize Standby.
- New/additional Storage can be requested through [the Storage Request Forms through the STAT Service Portal](#).
